

# Pediatric Procedural Sedation: Let's Get Familiar

By: Angela Hamilton & Beth Westbrook

Bachelor of Science in Nursing: Uvic at Selkirk College, Year 4

## Background of the topic

Procedural sedation is the process of utilizing short-acting analgesics and sedative medications to reduce discomfort and anxieties of certain medical procedures, in addition to facilitating successful and timely completion of the procedure.

## Problem

- Lack of familiarity related to the procedure from staff members at KBRH
- Outdated policy and procedure binder
- Confusion of roles
- No standard plan

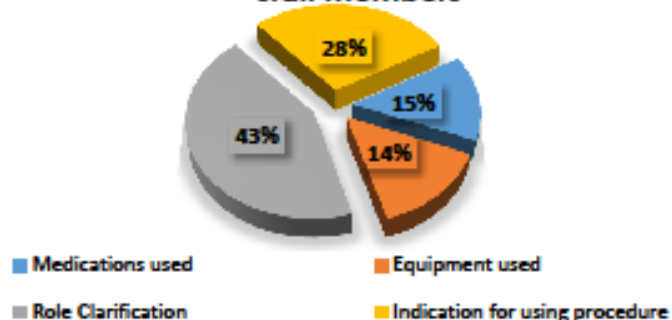

## Methods & Materials

- Internal data collection via feedback from staff members who participate in the procedure
- External data collection collaborating with other hospitals and reviewing the literature.
- Combining data collected into updated binder for KBRH pediatric floor
- Create a standard plan for Pediatric Procedural Sedation
- Providing in-service for staff to educate on updates

## Results & Conclusion

- After collaboration with physician, critical care team, nurses and field guide, an up-dated standard plan and resource binder was finalized
- Multiple in-services implemented to educate staff on updated material.

Areas for continued education identified by staff members

## Future Recommendations

- Updated Interior Health procedural sedation policy.
